
C: mean completeness (attack-event recovery) across valid active scenarios.

R: mean reliability ratio (R_{clipped}) across active (scenario, scale) cells.

S: survivability at Scale 50p under T1610+T1609 (ScenB); tightest confidence interval tier.

D: mean determinism ($1 - \sigma/\mu$, clamped to $[0, 1]$) across active cells.

All values in $[0, 1]$. Dotted red ring = $R = 0.80$ forensic sufficiency threshold.
